Background

Dhaka, Bangladesh is home to more than 3,394 slums with an estimated 175,931 households (BBS Slum Census 2014)

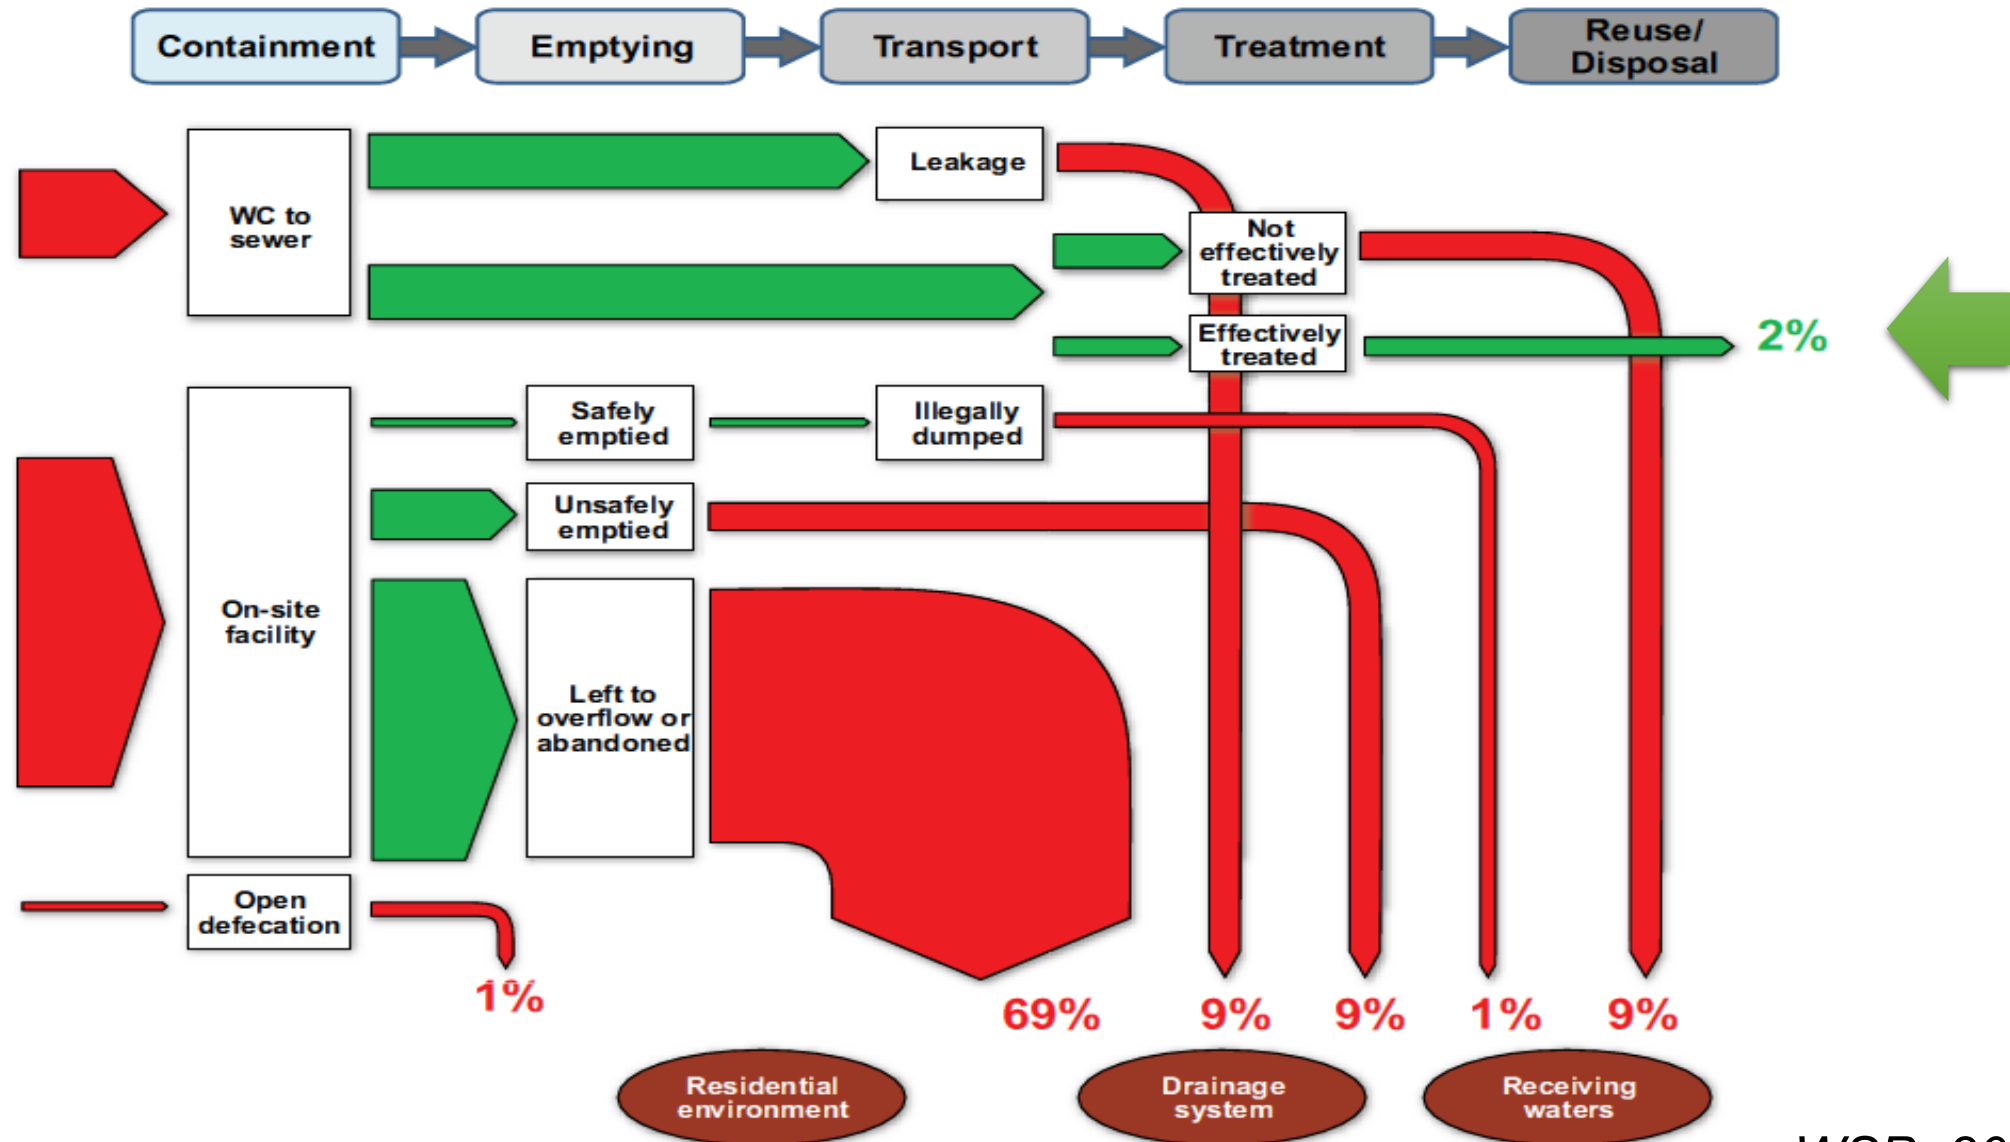

Photo: icddr,b

# Fecal sludge is not contained in Dhaka

# SaniPath

## Exposure Assessment Tool

The SaniPath Exposure Assessment Tool is designed to:

- **Assess public health risks** related to poor sanitation and FSM
- **Raise awareness** about these risks among stakeholders
- **Help prioritize sanitation investments** based on the exposures that have the greatest public health impact.

Our goal was to compare the exposure to fecal contamination from different environmental pathways in urban neighborhoods of Dhaka city, Bangladesh.

Methods

# Study Site

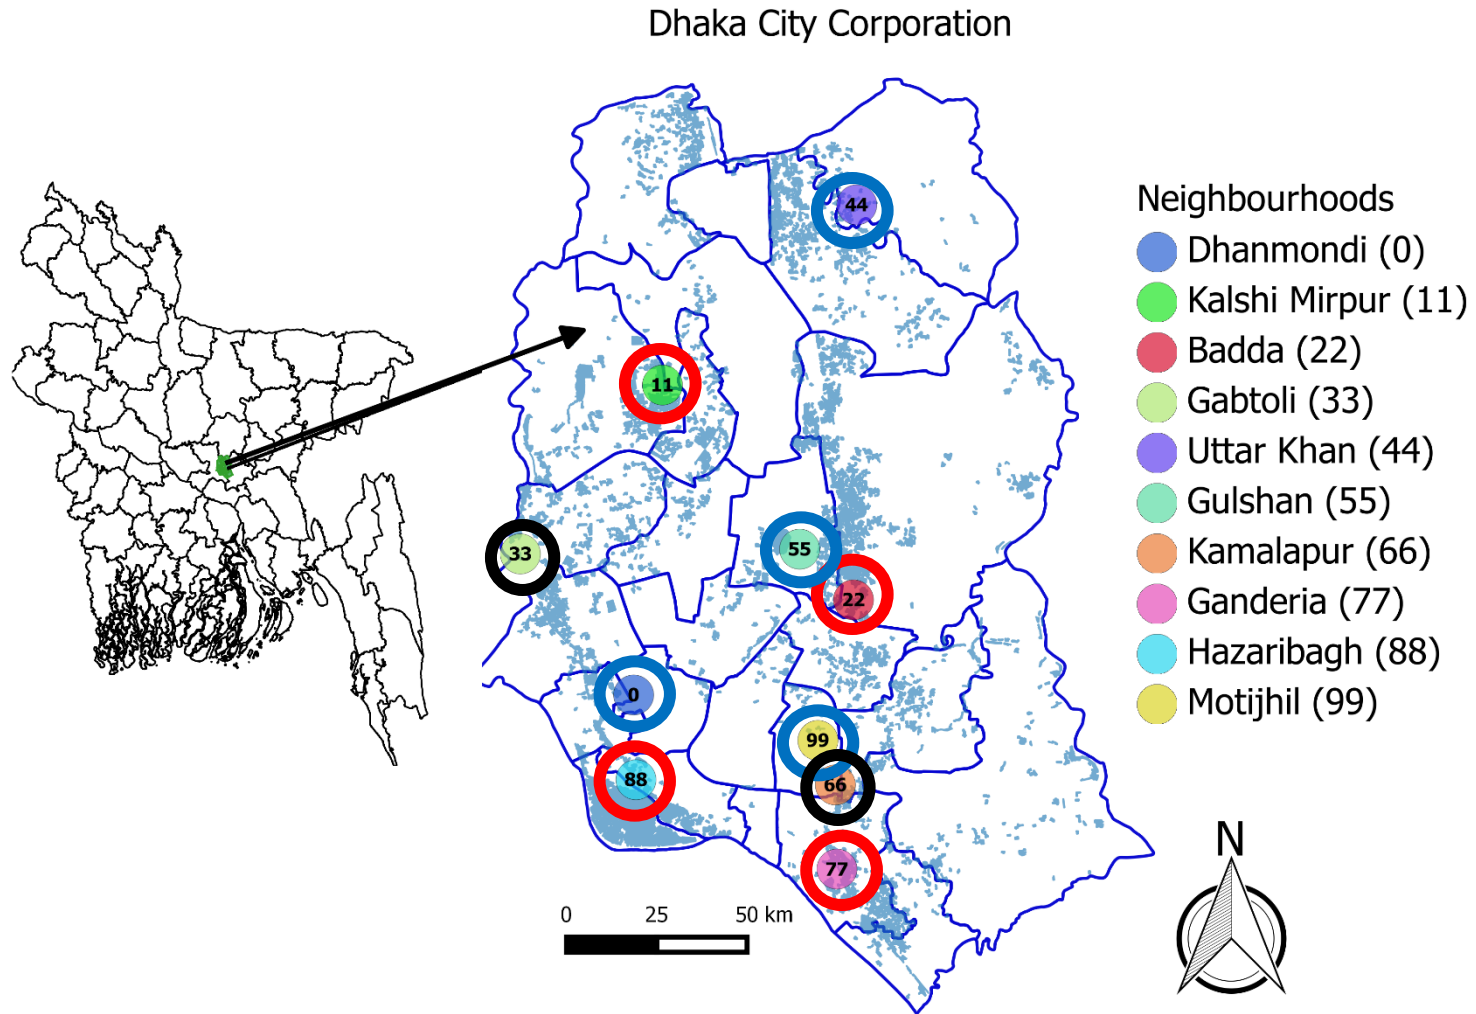

Figure: icddr,b

# The SaniPath Tool Deployment Process

Delwar Hossain, Yamini Ahluwalia, Martha Ormiston, Mourad Mokrane Creative Stall, Gregor Cresnar, and Alfredo Hernandez from the Noun Project created the icons interview, walking, neighborhood, swimming, water, pie chart, computer, and report. Schematic created by Suraja Raj and Alanna Shuh

# Pathways Investigated in Dhaka

Surface water

Non-WASA water

Soil

Latrine Swab

Flood water

Street food

Raw produce

WASA Water

Open drain

Bathing water

*Photos: Icddr,b*

# Data Collection Methods

- **Behavioral Exposure Data**

- reported frequency of behavior of adults and children that leads to exposure to fecal contamination

- **Environmental Microbiology Data**

- Collect environmental samples from relevant exposure pathways
- Analyze for *E. coli* via IDEXX

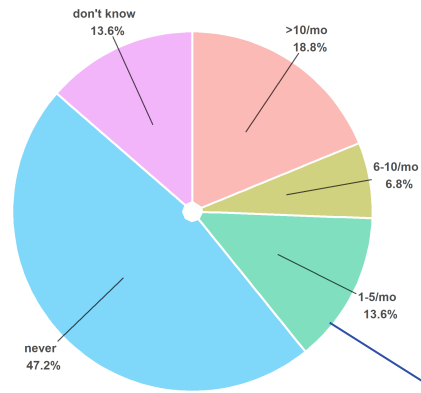

Photo: Icddr,b

# Estimating Exposure to Fecal Contamination

## Behavior Frequency

Drain Water  
Kanyama  
250 (N=Adults)

Tool uses Bayesian analysis to estimate the distribution of environmental contamination and frequency of exposure.

Other parameters: intake volumes, duration of exposure, etc.

Drain Water  
Kanyama  
Adults  
44.9% exposed  
3.66 MPN/Month \*E. coli\*

Results are presented in a normalized and comparable unit – Dose as MPN *E. coli* ingested per month

## Environmental Contamination

Drain Water

The mean dose and proportion of the population exposed are summarized from simulated distributions and displayed in risk profiles.

# Dominant Pathway(s)

The dominant pathway(s) is defined as the pathway(s) that make the greatest contribution(s) to the total exposure.

# Results

# Total Exposure for Adults

## Dominant Pathways:

- Produce (6)
- Street Food (5)
- Municipal Water (5)
- Open Drains (4)
- Surface Water (3)

### North

### South

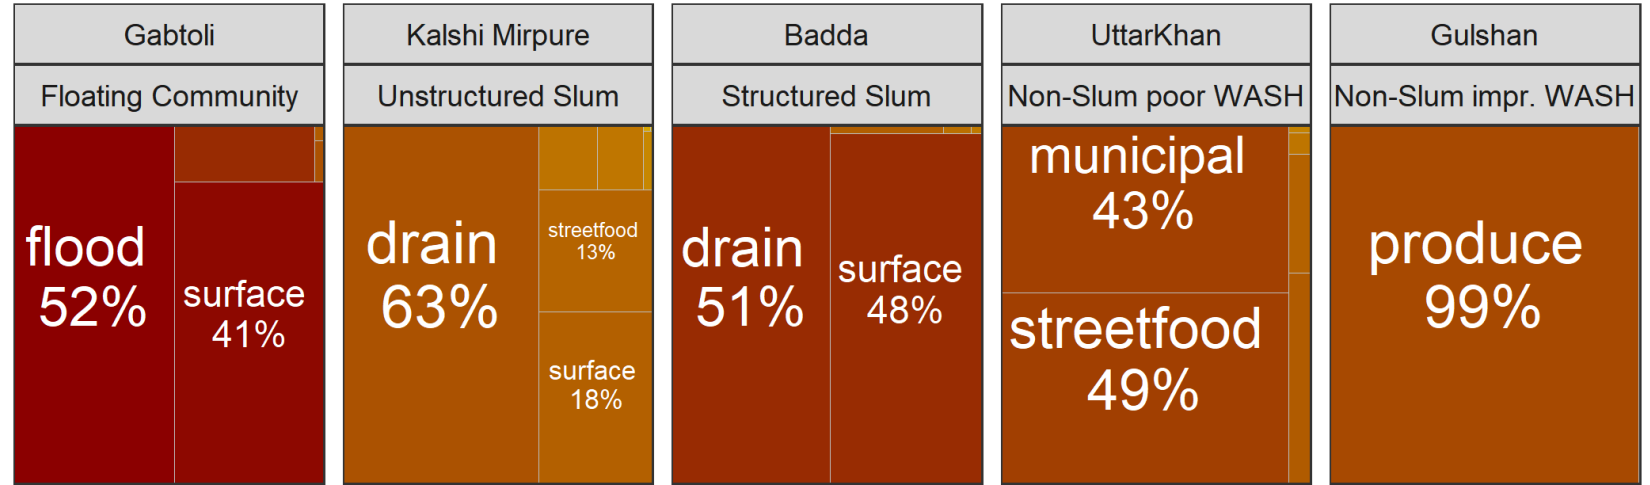

# Total Exposure for Children

## Dominant Pathways:

- Open Drains (7)
- Municipal Water (4)
- Surface Water (4)
- Produce (2)
- Street Food (2)
- Flood Water (1)

## North

## South

Exposure (log<sub>10</sub>) CFU/Month

# High Income Communities are Also Exposed to Contamination Through Produce and Street Food

North

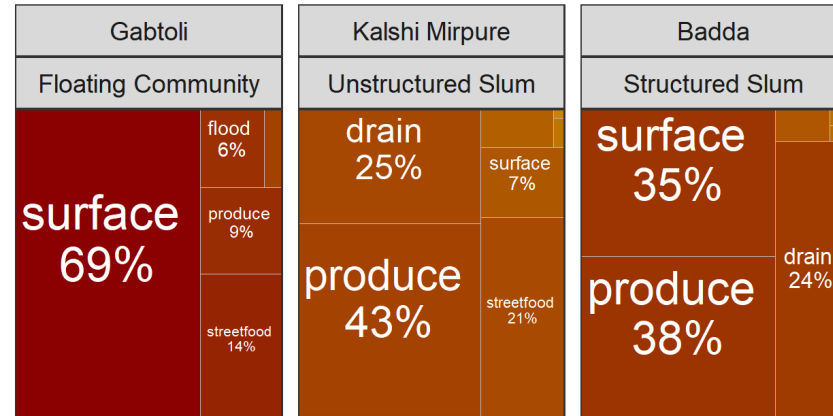

Low SES

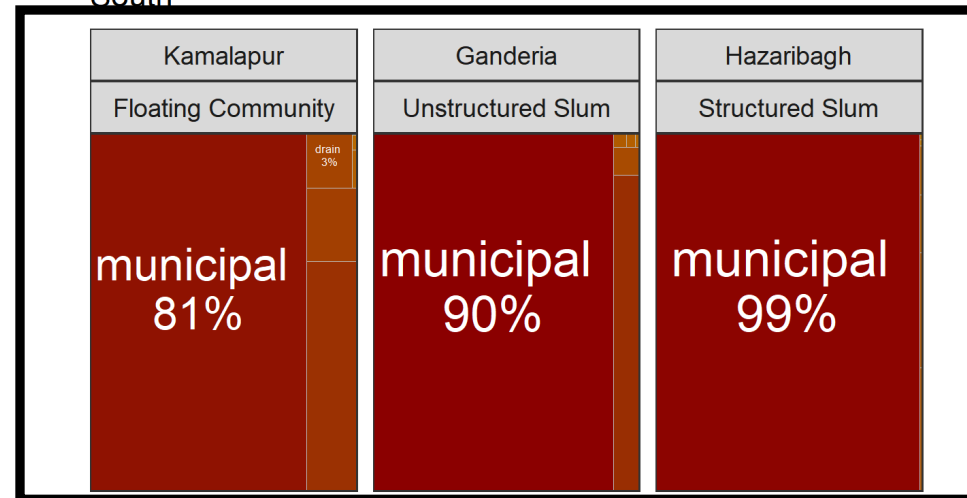

High SES

# Municipal Water Contributes More to Total Exposure in the South

North

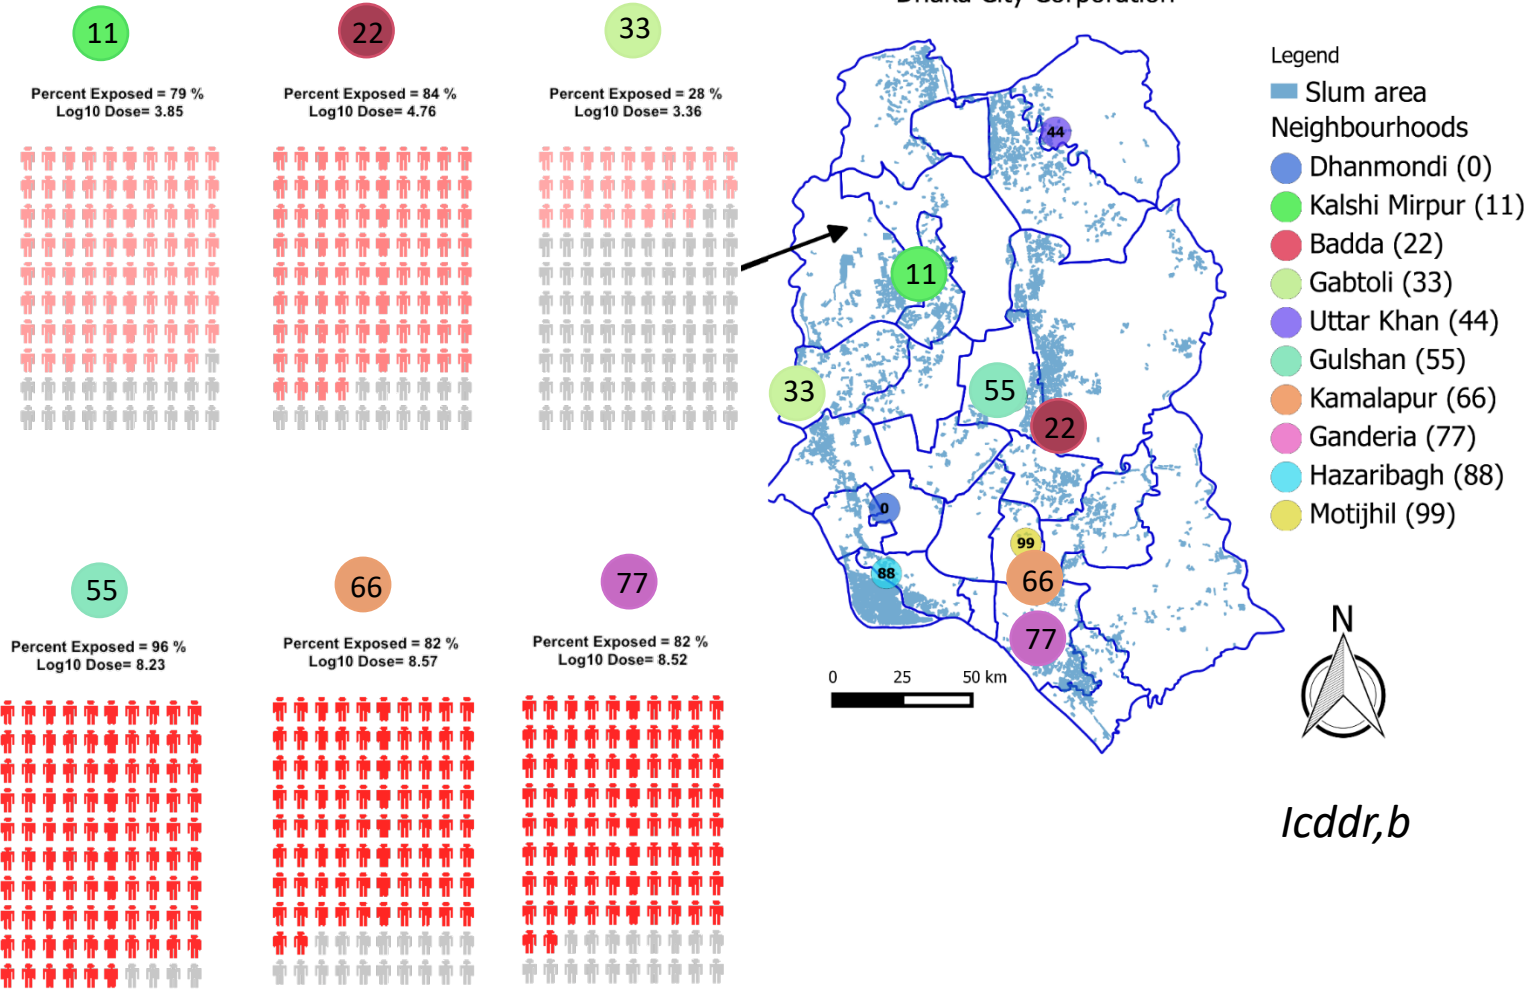

South

Exposure (log<sub>10</sub>) CFU/Month

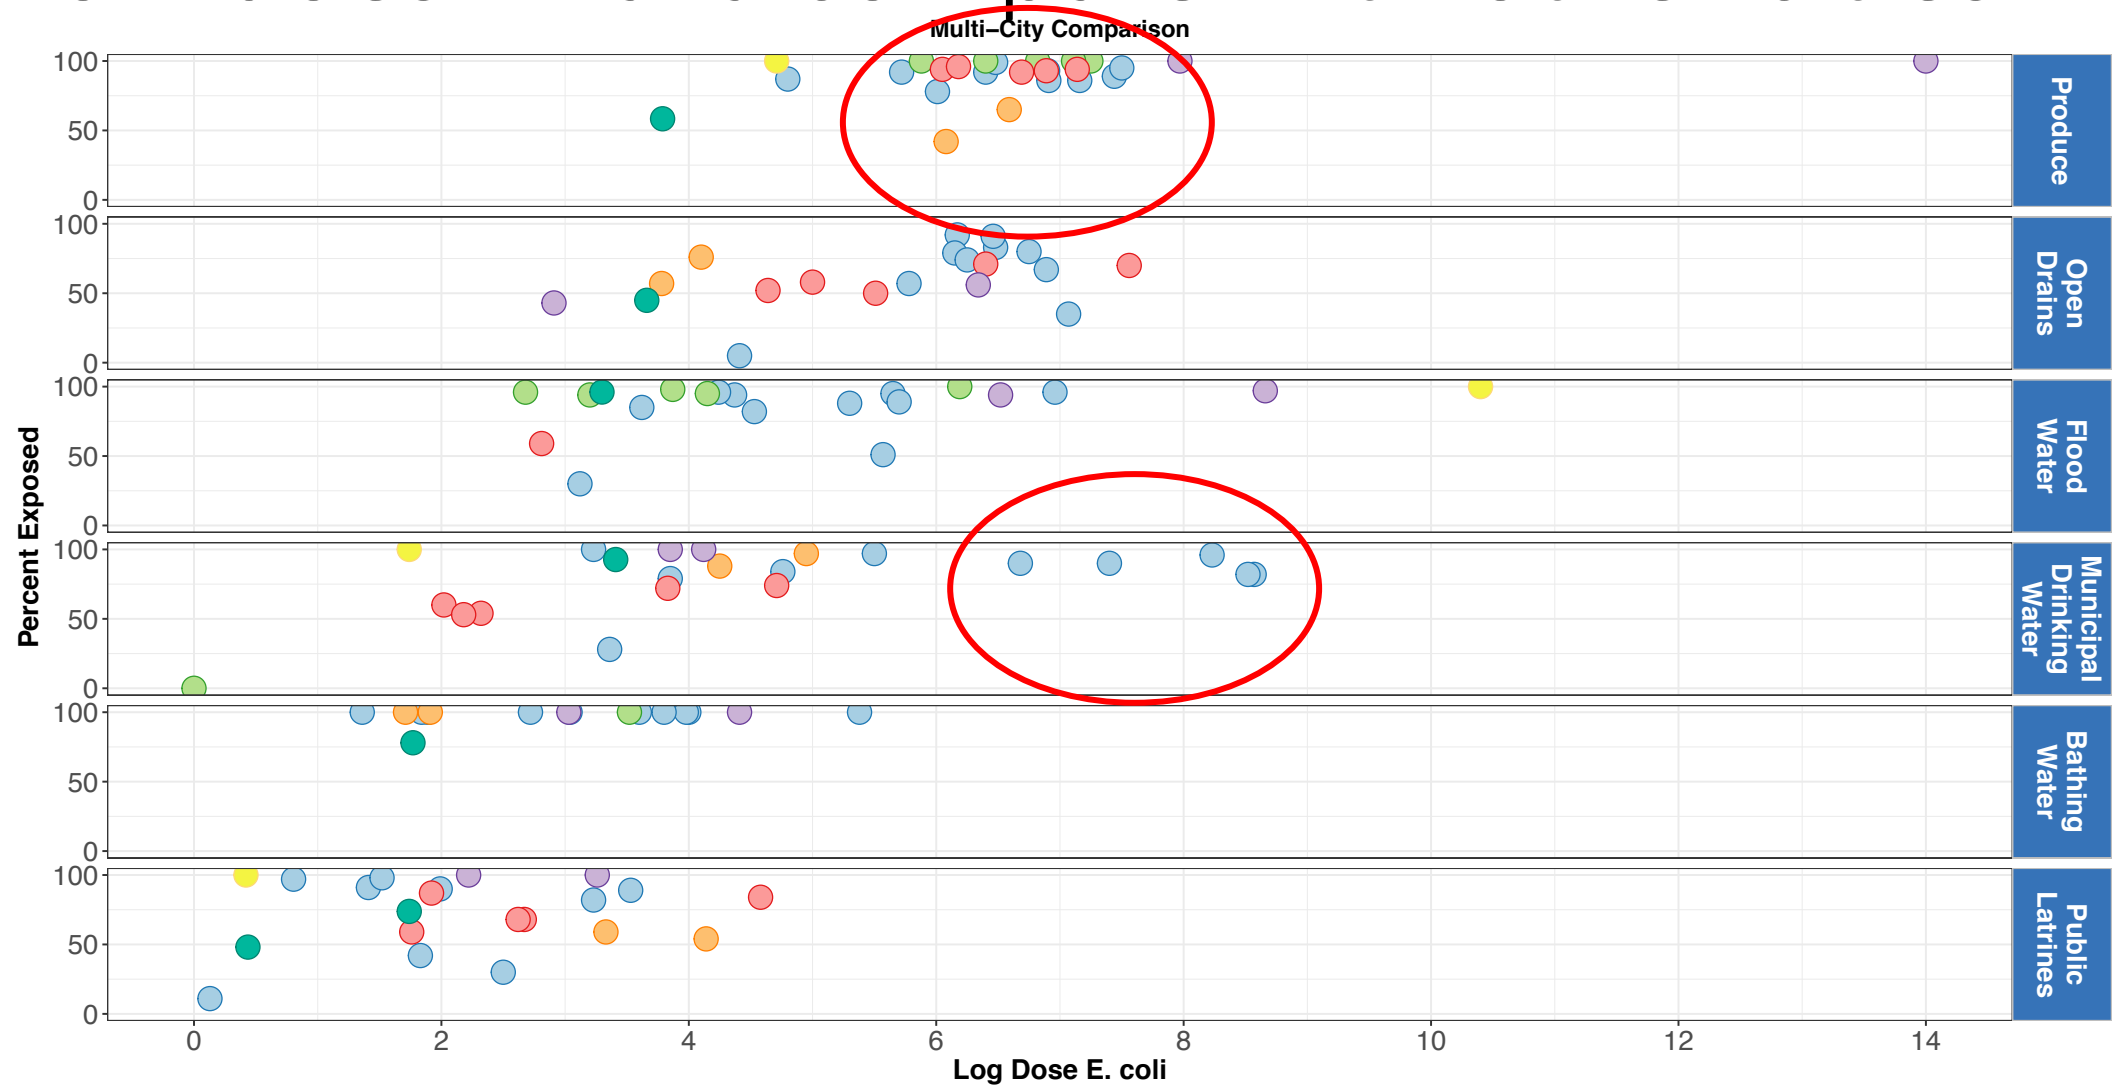

# A Closer Look: Municipal Water

So What?

# How does Dhaka compare with other cities?

Study Site

- Accra, Ghana
- Dhaka, Bangladesh
- Maputo, Mozambique
- Vellore, India
- Atlanta, USA
- Lusaka, Zambia
- Siem Reap, Cambodia

# Key Findings and Observations

- All dominant pathways were driven by both high contamination and high frequency of exposure
- Produce and street food were highly contaminated and frequently consumed across the city in all neighborhoods
- Important differences between risks for adults and children (see dominant pathways)
- SES and geographical location may be good predictors of WASH quality and fecal exposure for certain pathways such as municipal water, surface water, open drains, and flood water

# Limitations

- 10 neighborhoods is a small portion of Dhaka
- Challenges in collecting data from high-income neighborhoods
- Capturing Rainy Season
- Limitations of SaniPath Tool
  - Single cross-sectional deployment
  - Relies on self-reported behavior
  - Hygiene, food preparation, and risk mitigating behaviors are not considered in model
  - Limited published literature on intake and duration of exposure activities
  - No household-level fecal contamination

# Next Steps

- Stakeholder meeting to share results
- Further studies on produce and street food in Dhaka
- Comparison of a city with “poor FSM” (Dhaka, Bangladesh) and “improving” FSM (Durban, South Africa)
- Multi-city comparisons and standardized exposure assessment
